

## **ABSTRACT OF THE DISCLOSURE**

A surveillance camera system includes a multiplexer. A camera switch circuit provided on the multiplexer selects each of a plurality of surveillance cameras in a time-division manner. An image processing circuit included in the multiplexer fetches a photographed image signal output from a selected surveillance camera, and adds VBI  
5 information having a recording bit of "1" to the photographed image signal at a timing according to a recording mode setting. An HDR recodes the photographed image signal in a hard disk when the recording bit included in the VBI information is "1".
